

Wargrave surgery is still open for your baby's vaccination and immunisation schedule

One of the best ways to protect your baby against diseases like measles, rubella, tetanus and meningitis is through immunisation. Your baby needs their first injections at eight weeks, then 12 weeks, 16 weeks and one year.

Vaccinations are offered free of charge in the UK – just book your appointments with your GP. Remember, as well as protecting your own baby, you're also protecting other babies and children by preventing the spread of disease.

These are the vaccinations your baby will need:

8 weeks:

- **6-in-1** vaccine
- **RV** (rotavirus) vaccine
- **MenB** vaccine

12 weeks:

- 6-in-1 vaccine – 2nd dose
- **PCV** (pneumococcal) vaccine
- RV (rotavirus) vaccine – 2nd dose

16 weeks:

- 6-in-1 vaccine – 3rd dose
- MenB vaccine – 2nd dose

1 year:

- **Hib/MenC** vaccine given as a single jab containing vaccines against meningitis C (1st dose) and Hib (4th dose)
- **MMR** vaccine (measles, mumps and rubella), given as a single jab
- PCV (pneumococcal) – 2nd dose
- MenB vaccine – 3rd dose
